

## Lower Feed Cost & Increase Milk

Intensive Dairy Care, Green Bay, Wisc. --

I put AMAFERM in a high producing dairy ration, with a RHA of over 29,000 lbs. milk in Shawano County, Wisconsin. Along with the addition of AMAFERM, I increased forage, soluble protein and sugar while decreasing bypass protein and fat.

**We lowered the cost of the ration and saw a 6 lb milk increase in 2 weeks!!!** Production has held nicely and milk is 94 lbs per cow. The dairyman is happy with the extra milk and lower feed cost.

*Mike Biese*

— Mike Biese, nutritionist

### Update Mid-December 2010:

*The dairy continues to perform well and has reached 100 lbs of milk per cow.*

### Why AMAFERM in your ration?

- 1 Improves rate and extent of fiber digestion for increased nutrient availability
- 2 Increases microbial protein yield for improved efficiency
- 3 Increases lactate uptake by rumen bacteria for pH stabilization
- 4 Increase Volatile Fatty Acid (VFA) production for optimum energy
- 5 Reduces heat stress

Not a yeast or probiotic.  
Works in conjunction with antibiotics.
